I am writing this submission to reject the proposed extension of the Queensland government emergency act

- Currently there is plenty of evidence that the risk from covid is low with hospital admissions , death and serious illness easily managed.
- data clearly shows the risks associated with covid are exaggerated as shown in the ABS data reporting .
- Cases no more serious than common influenza.
- average death age from covid related illness (and proven that most death reports had pre-existent co-morbidities and exceeds the average age of death in Australia.

Thankyou.

Sean Gribble
