Subject: Fluoridation of Bundaberg's Water Supply

**Hon Lawrence Springborg MP  
Minister for Health**

I would like to bring to your attention that the potential human health hazards and social costs of injecting Fluoride either Sodium Fluoride or Hydrofluorosillicic acid compounds into drinking water are staggering.

The fact that fluoride is known to be an enzymatic poison of critical pathways clearly demonstrates that these compounds should never be added to drinking water.

Fluoride in our drinking water is not a one size fits all element i.e fluoride is very bad for infants on formula made with water, this is surely a large portion of the population, people who are allergic to fluoride another segment, my wife for instance has to drink at least 2 litres of water a day for health problems is she going to overdose on fluoride, unlike prescribed medication a dose is printed on the product & Fluoridation is forced medication & has no instruction as to dosage.

There is so much information available now that this has very significant implications for the Health Service charged with responsibility for the provision of safe drinking water.

I would like to suggest there is no justification in any circumstance to continue with a policy of water fluoridation that could endanger the health & wellbeing of consumers.

Regards John Rodgers
