### Submitter Comments:

As a form of waste reduction and recycling the committee must give credit to the fact there are technologies which can provide alternative solutions to the problem of waste and waste management including landfill management. We can take all wastes and provide stable reliable base-load power whilst producing other products such as Oil or Bio Diesel from waste and provide a total solution that we like to call "Virtual Landfill". There must be some consideration given to the technology available and solutions able to be provided and the Hierarchy of waste management be reviewed, because of the fact that at number 3 in the hierarchy the reuse of waste, what is reuse when we take general waste, tyres, plastic waste and turn these into other products including oil, bio-char, bio-fuels, raw products such as plastic olefin and polyolefin. At the same time as production of Power. This is a fundamental design flaw in many legislation's as when we apply we make mention of the ability to change and reuse the waste and power is not considered high enough so at times we are in limbo from the legislation's. As we are aware many of the recycling options are not available and most all waste is currently heading to landfill, now surely there should be consideration to the technology in its own right and merit to enable us to find a total solution to the issue of waste without the need for more landfills
