Subject: Submission on Environmental Protection (Great Barrier Reef Protection Measures)
Date: Wednesday, 13 March 2019 2:06:17 PM

The Great Barrier Reef is a massive symbiotic ecosystem comprising millions of progressively smaller ecosystems each dependent on the 'whole'.

The issue with pollution is that the damage is not apparent until it's too late. 'Too late' has come and gone for so much of the reef. The science has spoken for so long without being heard. It's not save the reef now, it is 'salvage what's left'.

There are so many pressures on the reef and pollution is just one. Token gestures and 'Band-aides' will not help. It has to be serious change.

Capitalism would only work for the planet if it stuck to the rules. Human nature - power money and sex - ensures that will never happen.

Make an effort, delay the inevitable and hope some future generation will really understand and actually 'restore the reef'.

Yours Sincerely,

Adrian Bright
