

**Question on Notice  
No. 196  
Asked on 1 March 2006**

MRS PRATT asked the Minister for Health (MR ROBERTSON)

**QUESTION:**

With reference to mental health, suicides and depression—

- (1) How many people in Queensland hospitals have or are being treated for depression each year, since 2000?
- (2) Of the total number of depression cases reported to Queensland Health, how many have ended up in the patients committing suicide each year since 2000?
- (3) Of the total number of depression and depression-related cases reported each year since 2000, how many are in rural and regional Queensland compared to urban areas?

**ANSWER:**

In responding to the questions asked, it must be noted that there are significant limitations on the data including:

- the data only reflects the total number of admissions per annum;
- the data does not include people diagnosed with other depression-related illnesses;
- the data does not reflect the number of people who remain untreated in the community or those who seek treatment via the primary health care system (General Practitioners);
- the data does not delineate between the same person being admitted for example on five separate occasions, to a person admitted for the first time; and
- the data is not representative of the number of people diagnosed and treated for depression by community mental health services.

- (1) The following table provides data on the admitted patient episodes of care where the principal diagnosis is depression.

<b>Financial Year</b>	<b>Public Hospitals</b>	<b>Private Hospitals</b>	<b>Total</b>
1999/2000	3,679	4,411	8,090
2000/2001	3,844	5,244	9,088
2001/2002	3,832	6,903	10,735
2002/2003	4,228	6,831	11,059
2003/2004	4,714	6,504	11,218
2004/2005	4,116	6,592	10,708

(2) The total number of depression and depression-related illnesses can not be matched to the number of individuals who have committed suicide since 2000.

Data available on suicide however indicates that the Queensland suicide rate is 13.7 per 100,000 of population, an overall decrease in rates across all ages since 1997.

(3) The attached table provides a breakdown of totals provided in (1) above by the usual location of residence.

I should point out that specific data for psychiatric hospitals is not included in (1) and (3) above as the data is incompatible and unreliable for inclusion. I would point out however, that psychiatric hospitals generally do not deal with patients suffering from depression. Patients suffering from depression are treated in the least restrictive manner which means they are normally treated in a community or normal inpatient setting.
